Disease using ECG and Imaging

Abstract:
Early detection of heart diseases is crucial as cardiovascular diseases remain a leading cause of death worldwide. Timely and accurate diagnosis with minimal cost can significantly improve patient outcomes. Traditional machine learning algorithms such as Random Forest, Naive Bayes, and Support Vector Machines have been used for prediction, but they often lack high accuracy and robustness.

This study proposes a deep learning-based ResNet50 framework for multi-class classification of ECG images. The dataset consists of 4568 images categorized into five classes: AHB, COVID-19, HMI, MI, and Normal. The model is trained using transfer learning with frozen top layers and optimized through multiple preprocessing techniques.

The proposed model achieves an overall accuracy of 87.70%, with strong performance across different classes. ROC analysis shows AUC values ranging from 0.87 to 0.97, indicating high classification capability. The results demonstrate that deep learning significantly improves feature extraction and classification performance compared to traditional approaches.

This work highlights the potential of AI-based systems in assisting clinical diagnosis and early detection of heart diseases.
